

QuickCart Pass

End-to-End Growth Funnel & Subscription Conversion Strategy

The Challenge

Solving Quick-Commerce Cart Abandonment & Driving High-LTV Retention

Presented By

Shubhi Saini

Digital Commerce & Growth Strategy

Behavioral Targeting

Precision-matched messaging to user order history

Friction Interception

Point-of-abandonment subscription conversion

LTV Extension

Retention-first model to maximize subscriber lifetime value

The Problem Statement

Context

Quick-commerce platforms depend on **high-frequency repeat orders** to sustain unit economics. However, delivery fee friction at checkout creates a critical breakdown in the conversion funnel — triggering severe cart abandonment precisely when purchase intent is highest.

Objective

Map a **5-stage behavioral growth funnel** — from Awareness to Retention — for **QuickCart Pass**, a delivery-fee-waiving subscription model designed to eliminate the #1 checkout friction point.

The 5-Stage Funnel Architecture

O1

Awareness (TOFU)

Peer referral & organic acquisition

O2

Engagement (MOFU)

Behavioral push notifications

O3

Consideration (MOFU)

Trust-building & delivery guarantees

O4

Conversion (BOFU)

1-click checkout trial interception

O5

Retention (LTV)

Savings proof & churn prevention

Core Pillar 1 — Behavioral Targeting

Every tactic is anchored to real user signals — recent order history, category preferences, and checkout behavior — ensuring messaging is always contextually relevant.

Core Pillar 2 — Point-of-Friction Interception

Intervene at the exact moment a delivery fee triggers abandonment, converting high-intent shoppers into long-term subscribers with minimal resistance.

Core Pillar 3 — LTV Extension

Post-conversion engagement proves tangible financial ROI to subscribers, reducing voluntary churn and sustaining 90-day retention targets.

5-Stage Lifecycle Tactics & Rationale

STAGE 1

Awareness — Top of Funnel (TOFU)

Tactic: Peer-to-peer referral program rewarding active subscribers with **1 free month** per successfully converted friend referred.

Rationale: Amplifies organic reach through peer trust networks — the highest-credibility acquisition channel available. Addresses word-of-mouth as the primary organic acquisition driver in hyperlocal quick-commerce markets, where community density makes peer influence disproportionately powerful. Incentive structure ensures only high-intent referrals are rewarded, protecting CAC efficiency.

- Word-of-mouth referrals consistently convert at 3–5× the rate of paid acquisition channels.

STAGE 2

Engagement — Middle of Funnel (MOFU)

Tactic: Category-personalized push notifications dynamically surfacing subscriber savings — e.g., *"Save ₹150 on Fresh Produce & Dairy"* — triggered by recent order category behavior.

Rationale: Category-specific personalization achieves significantly higher open rates versus generic mass blast campaigns. By leveraging behavioral targeting on recent order history, messaging arrives at peak relevance — when a user is already thinking about their next purchase in that category. This approach respects notification fatigue while maximizing engagement per send.

Key Behavioral Signal Used

Last Order Category

Map notification to matching category savings

Order Frequency

High-frequency users receive more aggressive trial CTAs

Time of Day

Notifications timed to habitual ordering windows

5-Stage Lifecycle Tactics & Rationale

1

Consideration (MOFU) — Build Trust at the Decision Threshold

Tactic: Live "**On-Time Delivery Rate & Guarantee**" widget embedded on the subscription landing page, paired with instant late-order account credits issued automatically for any missed delivery estimate.

Rationale: Repairs consumer trust via radical transparency and real-time social proof. Directly addresses the core negative feedback loop surrounding missed delivery estimates — a leading reason prospective subscribers hesitate to commit. Instant credits demonstrate accountability without requiring customer service escalation.

2

Conversion (BOFU) — Intercept at Maximum Purchase Intent

Tactic: **1-click checkout prompt** surfaced at the payment screen, offering a 14-day free trial that immediately waives the current order's delivery fee — zero friction, zero pre-commitment.

Rationale: Intercepts high-intent shoppers at the **primary point of cart abandonment** — the moment the delivery fee appears. By collapsing the trial sign-up to a single tap, the cognitive cost of conversion is eliminated. The fee waiver provides an immediate, tangible reward that validates the subscription value proposition in real time.

3

Retention (LTV) — Prove Financial ROI, Prevent Churn

Tactic: Monthly personalized "**Subscription Savings Summary**" push notification — surfacing total delivery fees saved, orders placed, and categories purchased — plus automated pre-renewal reminder 7 days before billing cycle.

Rationale: Proves tangible financial return-on-investment to the subscriber, making the ₹99/month cost feel deeply justified versus the alternative of per-order fees. Leverages personalized order history to make each digest uniquely relevant. The pre-renewal reminder reduces passive churn from payment failures or forgotten subscriptions.

Channel & Capital Budget Allocation

Budget weighted toward BOFU conversion — where subscription trials are won or lost.

35% — Top-of-Funnel Acquisition

Channels: In-app referral pop-ups, micro-influencer unboxings on Instagram Reels, localized Meta Ads targeting hyperlocal delivery zones.

Goal: Drive high-intent referral traffic from peer networks and socially-validated audiences who exhibit strong purchase propensity.

25% — Middle-of-Funnel Nurture

Channels: Segmented push notifications by order category, personalized in-app banners, retargeting ads featuring delivery guarantee messaging.

Goal: Nurture active app visitors who have demonstrated purchase intent but have not yet initiated a subscription trial.

40% — Bottom-of-Funnel Conversion & Retention

Channels: In-cart trigger overlays at payment screen, automated transactional SMS/email sequences, monthly Savings Digest push notifications.

Goal: Convert cart abandoners at the fee-friction moment and maximize 90-day subscriber retention post-trial.

High-Converting Push Notification Copy Templates

Three proven copy frameworks mapped to distinct behavioral segments — each crafted to surface category-relevant savings at the moment of highest purchase intent.

Fresh Produce & Staples Variant

Header: Zero Delivery Fee on Your Weekly Essentials!

Body: Ordering Fresh Vegetables & Dairy today? Skip the ₹49 delivery fee with QuickCart Pass. Start your 14-day free trial!

Trigger: User has Fresh Produce or Dairy in active cart

Snacks & Beverages Variant

Header: Late Night Cravings? Delivery is on us.

Body: Got Snacks & Cold Drinks in your cart? Waive the delivery fee instantly. Try QuickCart Pass free for 14 days.

Trigger: User ordering in evening/late-night window with snacks in cart

Monthly Savings Digest — Retention Variant

Header: You saved ₹340 this month!

Body: Thanks to QuickCart Pass, you paid ₹0 in delivery fees on your last 3 Bakery & Pantry orders. Keep saving next month!

Trigger: Monthly automated send to all active subscribers, personalized with real savings data

 All templates use dynamic personalization tokens — category name, savings amount, and order count are pulled from live user data at send time.

Checkout Conversion A/B Testing Framework

Objective: Intercept cart abandonment at the payment fee screen — the highest-leverage conversion moment in the QuickCart Pass funnel — by testing two distinct value proposition framings.

VARIANT A — CONTROL

Instant Free Trial Framing

"Waive today's ₹49 fee instantly with a 14-day Free Trial of QuickCart Pass."

Hypothesis

Zero-risk framing (free trial, no commitment language) lowers the psychological barrier to activation. Users who are fee-averse but subscription-skeptical are more likely to tap when no payment is required upfront.

Primary Metric

Trial activation rate from payment screen

Secondary Metric

14-day trial-to-paid conversion rate

VARIANT B — CHALLENGER

Direct Monetary Offset Framing

"Pay ₹99/month for QuickCart Pass today and get today's ₹49 delivery fee waived immediately (Net cost: ₹50)."

Hypothesis

Explicit net-cost anchoring (₹50 net outlay) appeals to value-maximizing users who are already subscription-comfortable and respond to rational cost framing over trial-risk framing. May attract higher-quality, lower-churn subscribers.

Primary Metric

Direct paid subscription conversion rate

Secondary Metric

90-day retention rate vs. Variant A cohort

Test Duration

Minimum 2 billing cycles to capture statistically significant trial-to-paid conversion signal

Audience Split

50/50 random assignment at payment screen entry; stratified by order value and category

Success Signal

Variant declared winner if it achieves $\geq 15\%$ lift in 90-day retained paid subscribers

Guard Rail

Monitor overall cart completion rate — if either variant depresses checkout completion, halt test

Success Metrics & KPI Dashboard

Three mission-critical KPIs mapped to the three highest-leverage funnel stages — each designed to measure a distinct behavioral outcome that drives QuickCart Pass growth.

3

Core KPIs

Covering Awareness, Conversion, and Retention stages of the full 5-stage funnel

14

Day Free Trial

The trial window used as the primary conversion activation trigger at the payment screen

90

Day Retention Window

The primary long-term retention measurement period post-trial activation

Funnel Stage	KPI	Definition & Objective	Strategic Importance
Awareness TOFU	Referral Sign-up Volume	Total new users registered via peer referral links — measures the organic amplification power of the subscriber base.	Low-CAC acquisition channel; high referral volume signals strong subscriber NPS and product-market fit.
Conversion BOFU	Checkout Fee-Screen Conversion Rate	% of users who activate a subscription trial directly from the payment screen — measures friction interception effectiveness.	The highest-leverage single metric in the funnel; directly measures the core value proposition of QuickCart Pass at point of maximum intent.
Retention LTV	90-Day Subscriber Retention Rate	% of users remaining active, paying subscribers 90 days after trial activation — measures whether the subscription delivers perceived ongoing value.	The ultimate proof of LTV viability; a strong 90-day rate validates that the Savings Digest and behavioral personalization strategy is preventing passive and active churn.

📌 These three KPIs form a connected measurement system — Referral Volume feeds trial volume, trial conversion rate determines subscriber base size, and 90-day retention determines whether the business model is financially sustainable at scale.
